

Blockchain-based traceability for vineyard planting authorizations and product authenticity to streamline EU regulatory compliance and databank reporting.

Public / Government sector × Product traceability and digital product passport × Blockchain and DLT · OS065 v1 · refreshed 2026-08-18

ATTRACTIVENESS	RIGHT TO WIN	COMPETITION	SERVICEABLE MARKET	HORIZON	PORTFOLIO
53 is the world moving	29 can we play, can we win	MEDIUM 1 named in the evidence	€220m observed evidence · per year	NEXT regulation adopted or propose...	L3 10 signals

Attractiveness and right to win are scored and displayed separately and are never combined (SC-12). Competition is a fourth quantity, not a discount on either.

The opportunity

This opportunity is a blockchain-based traceability service for vineyard planting authorizations and wine product authenticity, helping EU wine producers and regulators streamline compliance with new EU rules and databank reporting. It exists now because the EU has adopted rules on vineyard planting authorizations and the analytical databank, and the broader push for Digital Product Passports is raising the bar for traceability across regulated sectors.

Market opportunity

Method	Total (TAM)	Serviceable (SAM)	Obtainable (SOM)	Confidence
Observed: tendered contract value, annualised	€220m €220m – €482m	€220m €220m – €482m	€275k €275k – €602k	observed

All figures are annual, in EUR. Ranges compound the uncertainty of each factor below; the base case is the middle column of each.

Observed: tendered contract value, annualised

Factor	Value	Basis	Source	As of
Tendered contract value in matching CPV categories	€220m per year	observed	TED (Tenders Electronic Daily) · ted	2026-05-19..2026-08-05
Assumed obtainable share of the serviceable market	0.1 % of SAM	assumption	config/sizing.yaml · obtainable_share	size-2026-08-a

Read this before quoting the number. Observed over 85 days of TED coverage and scaled to a year (x4.3); a short collection window makes that scaling rough. 34 matching notices, matched on vertical via the CPV crosswalk — §4.5.2's warning applies: a crosswalk error lands directly in this number. Public procurement only. Private-sector demand for the same capability is not visible here at all, so this is a floor rather than a market size.

The solution, in one picture

Blockchain Traceability for Vineyard Compliance

This diagram shows how vineyard data flows from producers through Orange's blockchain platform to EU databank reporting, ensuring integrity and compliance.

Boxes marked as Orange assets are validated against the linked business graph; a box the model claimed for Orange without a matching asset is shown as third party.

What has changed

The EU has adopted rules on authorizations for the planting and replanting of vineyards and on the functioning of the analytical databank, creating a regulatory driver for digital traceability. The EU Digital Product Passport is emerging as a traceability deadline, pushing industries to adopt more robust data systems. Academic research increasingly demonstrates that blockchain and DLT can address supply chain transparency, data integrity, and fraud issues in agricultural supply chains, making the technology mature enough for real-world deployment.

Who buys, and why now

The buyer is likely a national or regional agricultural authority responsible for enforcing vineyard planting rules and managing the analytical databank, or a large wine producers' association. The pain is operational: manual verification of planting authorizations, fragmented data across stakeholders, and difficulty proving authenticity in export markets. The trigger is the new EU regulation requiring more rigorous reporting and the need to avoid penalties for non-compliance.

Why it is hot now — every claim bound to a dated source

- EU rules govern authorizations for vineyard planting and the analytical databank. [SIG-35103D30CD82]

What Orange would deliver, and why it can win

What Orange would deliver

Orange would assemble a blockchain-based traceability platform using its Blockchain and DLT technology, supported by its AI / Data / Cloud experts and Digital experts. The engagement would start with a pilot with a regional authority or

producer group, mapping current authorization and databank processes, then deploying a permissioned blockchain to record planting authorizations and product movements, and finally integrating with existing databank reporting systems. Orange's ISO 27001 and SecNumCloud certifications would underpin the security and sovereignty of the solution.

Why Orange can win

Orange can win because it combines its own Blockchain and DLT technology with certified cloud infrastructure (ISO 27001, SecNumCloud, CISPE) and deep expertise in AI/Data/Cloud and digital services. The reference of Grand Paris Sud demonstrates experience in public-sector digital projects. However, the assets specific to agriculture or wine are thin; Orange would need to build credibility in this vertical quickly.

Named assets behind this — each individually inspectable (LK-08)

Asset	Type	Link	Why it is linked	Curator
Blockchain and DLT	technology	L3	no offer path, but adjacent assets or Orange research exist	unconfirmed

Competitive landscape

MEDIUM competitive intensity (score 3.0; 1 of 8 listed players appear in this topic's own evidence)

A real field, including at least one player the customer will already know. Expect to be compared.

Competitors include global systems integrators like Accenture, Atos/Eviden, Capgemini, IBM, and Sopra Steria, who are active in the public sector and can offer end-to-end integration. Databricks is named in the evidence as a data platform that could address the databank side. Telecom peers Deutsche Telekom/T-Systems and Telefonica Tech also compete in public sector cloud services. The customer will compare on domain expertise, regulatory familiarity, and ability to integrate with existing systems.

Competitor	Category	Position here	Basis	Evidence
Databricks	Data and AI platform	competes in Cloud	evidenced	SIG-BC952EFA76FC
Accenture	Global systems integrator	active in Public / Government sector; competes in Cloud	structural	—
Atos / Eviden	Global systems integrator	active in Public / Government sector; competes in Cloud	structural	—
Capgemini	Global systems integrator	active in Public / Government sector; competes in Cloud	structural	—
Deutsche Telekom / T-Systems	Telecom operator peer	active in Public / Government sector; competes in Cloud	structural	—
IBM	Global systems integrator	active in Public / Government sector; competes in Cloud	structural	—
Sopra Steria	Global systems integrator	active in Public / Government sector; competes in Cloud	structural	—
Telefonica Tech	Telecom operator peer	active in Public / Government sector; competes in Cloud	structural	—

evidenced means this topic's own sources name the competitor — the signal ids are in the last column and are dated and clickable in the radar.
structural means the curated register says they sell this technology into this vertical, which is true but is not proof they are in this deal. Register version competitors-2026-08-a.

Qualifying questions for the first meeting

- 1 How do you currently manage and verify vineyard planting authorizations across your region?
- 2 What is the biggest pain point in your current databank reporting process for the EU?
- 3 Have you already received any compliance warnings or fines related to planting authorization data?
- 4 Do you have a digital system in place for tracking wine products from vineyard to export?
- 5 Who in your organization would be responsible for implementing a new traceability system?
- 6 What is your timeline for complying with the new EU rules on vineyard planting authorizations?

Objections you will meet

They will say	You can answer
We already have a database for authorizations; why do we need blockchain?	That's a fair point. A traditional database can store records, but blockchain adds tamper-evidence and a shared, trusted view across multiple authorities and producers, which is exactly what the new EU databank rules are pushing toward. We can start with a hybrid approach that layers blockchain on your existing system.
This sounds expensive and complex to implement.	It can be, but we can scope a pilot with a limited set of producers to demonstrate value before scaling. Our cloud and blockchain expertise helps keep costs predictable, and the cost of non-compliance with EU rules could be higher in the long run.
We're not sure the EU will accept blockchain as a compliance tool.	That's a valid concern. The regulation doesn't specify technology, but it does require data integrity and traceability. Blockchain is a strong way to meet those requirements, and we can work with your legal team to ensure the solution aligns with regulatory expectations.

Risks and unknowns

The main risk is that the EU regulation may not mandate blockchain specifically, so the customer might settle for a simpler database solution. There is also uncertainty about the willingness of multiple stakeholders (growers, authorities, exporters) to adopt a shared platform. Orange's lack of a named agricultural or wine industry reference is a gap that could slow trust-building.

Next action, by role (FR-17)

Role	Do this next
Presales / Proposal	Prepare a bid brief for a public-sector tender on vineyard traceability, highlighting Orange's Blockchain and DLT technology, ISO 27001 and SecNumCloud certifications, and referencing Grand Paris Sud as a trusted public-sector partner.
Sales	In a meeting with a European public-sector agriculture or wine regulatory body, say: 'Orange can help you meet EU vineyard planting authorization and databank reporting requirements with a blockchain-based traceability solution, backed by our ISO 27001 and SecNumCloud certifications.'
Strategist / Innovator	Commission a deep-dive brief on how Orange's Blockchain and DLT capability can be positioned for EU vineyard traceability, leveraging ISO 27001 and SecNumCloud certifications, and identify potential public-sector partners.

Evidence

Every claim in this brief resolves to one of these. Tier 1 is an authoritative primary source; tier 4 is vendor-published material, discounted in scoring (§4.3.7).

How this brief was made

Computed, not written. Attractiveness, right to win, competitive intensity and every figure in the market-opportunity section are computed from stored inputs and can be re-derived (DR-05, NFR-01). No language model produced a number anywhere in this document (§4.4.4).

Written, then checked. The narrative sections and the solution diagram were generated from this topic's evidence and from the named asset and competitor lists. Factual sections must cite signal ids attached to this topic; sections that failed that check, or that contained a generated quantity or an unsupplied organisation, were removed rather than rewritten.

Removed by those checks in this brief: diagram (5 box(es) claimed to be an Orange asset that was not supplied — shown as third-party instead)
